

**CIS 658 – Making Our Rails App Pretty**  
**Winter 2019**  
**Homework #7**

**Due:** 6pm, March 14, 2019

In this assignment you will focus on making your Bugs Overflow Rails app more attractive using a responsive frontend framework of your choice.

**Bug Overflow: Iteration #3**

We've been postponing all styling of our app in the previous iterations. Using what you have learned in lecture this evening, let's dress up our app using Bootstrap (or an alternate frontend framework of your choice: Foundation, etc.) Here are the general requirements your solution needs to meet:

- Make your site support a universal navigation scheme with links to Home, Users, Bugs.
- Add a placeholder “splash” or homepage to your app, and make it your root page. Format the home page in an attractive manner and make sure it somehow features blurbs with links to the 3 most recently entered bugs.
- Style *all* of the view templates for one of your entity types (either bugs or users).

You have some freedom to style as you see fit, but do make sure each view is reasonably attractive and fully responsive.

**Deliverables:**

Provide the instructor a demo of your working app in class, or email me a link to a deployed copy of your app.
